Top-of-Pole Mount for 12 Modules (TPM12)
For Module Type H
ASSEMBLY INSTRUCTIONS
step-by-step assembly and installation
A few words about the product

The TPM12 for module type H is designed to mount on 8 inch SCH40/80 galvanized steel pipe (installer supplied).

Pipe size and foundation requirements are based on several factors including the array surface area, maximum design wind speed, exposure category, soil type, steepest expected tilt angle, and above-ground clearance.

For foundation and pipe size recommendations on a specific installation, please contact us at:
Phone: 800-260-3792
Email: info@plpsolar.com

About these Assembly Instructions

These instructions...

- Are intended to be used by individuals with sufficient technical skills for the task. Knowledge and use of hand tools, measuring devices and torque values is also required.
- Include various precautions in the forms of Notes, Cautions, and Warnings. These are to assist in the assembly process and/or to draw attention to the fact that certain assembly steps may be dangerous and could cause serious personal injury and/or damage to components. Following the step-by-step procedures and these precautions should minimize the risk of any personal injury or damage to components while making the installation not only safe but an efficient process.

Required Tools

- 7/16 inch wrench or socket for 1/4 inch module hardware
- 9/16 inch wrench or socket for 3/8 inch hardware
- 3/4 inch wrench or socket for 1/2 inch hardware
- 1-1/2 inch wrench or socket for 1 inch Pivot Bolt hardware
- Torque wrench
- Ratchet wrench
- Ratchet extension bar
- 3 to 6 foot level
- Tape Measure
- Square
## Assembly Instructions, Top-of-Pole Mount (TPM12) For Module Type H (Version 2, Rev E)

* Pivot Bolt length depends on the width of the Strongback width; as such a 3" wide Strongback uses a 5-1/2" Pivot Bolt and a 4" wide Strongback uses a 6-1/2" Pivot Bolt.
Step 1: Install the Mounting Sleeve on Vertical Pipe

Before installing the Mounting Sleeve, verify that the Mounting Pole is plumb to the ground and hasn't shifted or leaned while the concrete footing has cured. The Mounting Sleeve slips on top of the Mounting Pole and has six 1/2” Set Bolts which are used to secure it to the Mounting Pole. (See Figure 1-1)

A. Slip the Mounting Sleeve on top of Mounting Pole and slide it down until it rests/bottoms out on top of Mounting Pole.

B. Rotate the Mounting Sleeve so that the Support Bar Pivot Tab is pointing north and the Strongback Vertical Towers are leaning south.

C. Secure the Mounting Sleeve by tightening the six 1/2” Set Bolts. Torque each Set Bolt to 55-60 ft.-lbs.

Step 2: Install the Strongback to the Mounting Sleeve

The Strongback is attached to the Mounting Sleeve using the Pivot Bolt that passes through its two Vertical Towers and the Support Bar. The Support Bar is attached to the Strongback on one end and the Support Bar Pivot Tab of the Mounting Sleeve on the other end using 1/2” hardware.

A. Remove the Support Bar from the Strongback and re-install in the 0° elevation set point. Secure with the 1/2” hardware and finger tighten. (See Figure 2-1)
B. Remove the Pivot Bolt from the Mounting Sleeve and collect the 1/2” x 1-3/4” bolt, flat washers and lock washer needed to secure the Support Bar to its Pivot Tab on the Mounting Sleeve.

C. Orient the Strongback to the Mounting Sleeve with its Lower Support Bar positioned on the same side of the Mounting Sleeve as the Support Bar Pivot Tab.

D. Slide the Strongback between the two vertical mounting tabs, aligning the thru-hole of the Strongback with the holes of the two Vertical Towers.

E. Insert the Pivot Bolt along with one flat washer through the one Vertical Tower and the Strongback exiting the second Vertical Tower on the opposite side. Secure with the remaining flat washer, lock washer and hex nut. For now, finger tighten only to allow movement for the next step.

F. Pivot the Strongback and the Support Bar to align the mounting holes of the Support Bar with its Pivot Tab on the Mounting Sleeve. Slide the Support Bar over the Pivot Tab. Insert the 1/2” x 1-3/4” bolt and one flat washer thru the Support Bar and Mounting Tab and secure it with the remaining flat washer, lock washer and hex nut. **Torque hardware on both ends of Support Bar at 72-80 ft.-lbs.** (See Figure 2-3)

(continued on next page)
G. Return and tighten the Pivot Bolt. The Pivot Bolt cannot be left loose - the Mounting Sleeve Vertical Towers must be firmly clamped to the sides of the Strongback eliminating any gaps between the Vertical Towers and the Strongback. **Torque to 330-350 ft.-lbf.** (See Figure 2-4)

**Figure 2-3: Securing Support Bar to Mounting Sleeve**

**Figure 2-4: Tighten and Torque the Pivot Bolt**
Step 3: Install the Rail Angles to the Strongback

Rail Angles run in an E-W direction and are secured to the rail plates (welded to the Strongback) using the 1/2” x 1-3/4” bolts and hardware. Proper orientation of the Rail Angles to the Strongback is very important, follow these instructions carefully (See Figures 3-1 & 3-2). There are 6 Rail Angles to install.

A. Referring to Figure 3-1 for orientation of the Rail Angles position the Rail Angle on the Rail Plate of the Strongback and secure with 1/2” x 1-3/4” bolts and hardware. Finger tighten for now. (See also Figure 3-2)

**NOTE:**
Be certain that the orientation of the Rail Angles to the Strongback match these instructions.

**Figure 3-1: Orientation of Rail Angles to Strongback**

**NOTE:**
Finger-tighten the Rail Angles to the Strongback while installing. After PV Modules are installed, re-tighten to specified torque values.

**Figure 3-2: Installing Rail Angles to Strongback**
Step 4: Install the Module Rails to the Rail Angles

Module Rails run in an E-W direction and are secured to the Rail Angles using 3/8” x 1-1/4” bolts and hardware. There are 6 Module Rails to install.

Module Rails must also be properly oriented to the Strongback; if not the PV Modules will not align to the mounting holes of the Module Rails. (See Figure 4-1)

Start by installing the northern Module Rail first and work southward.

A. Referring to Figure 4-1 for orientation of the inboard Module Rails, position the first section of Module Rail (with its angle cut end positioned north) at the northern most position on the Cross-Bars. Align the Module Rail mounting holes with the holes of the Cross-Bar mounting tabs and secure with 3/8” x 1-1/4” bolts and hardware. Finger-tighten for now. (See also Figure 4-2)

B. Continue in this manner installing the five remaining Module Rails.

CAUTION:
This is a two person activity. Module Rails are unstable before they are fully secured to the Rail Angles. Module Rails must be held in place by one person while the second person aligns and secures them to the Rail Angles. Failure to do so could lead to serious personal injury.

NOTE:
Be certain that the orientation of the Module Rails to the Rail Angles match these instructions.
Step 5: Installing PV Modules to Module Rails

PV Modules are secured to the Module Rails using 1/4” x 3/4” bolts and hardware. Start with the interior PV Modules and work outward. This will simplify the process and make it safer by eliminating the need to reach over exterior Modules to install the interior Modules.

A. Place an interior PV Module on the Module Rails. Align the mounting holes and secure with 1/4” x 3/4” bolts and hardware; each Module has four attachment points. Finger-tighten for now. (See Figure 5-1)

B. Continue in this manner to install all southern most PV Modules first and then work in a northern direction installing the remaining Modules.

Step 6: Now return and tighten mounting hardware.

A. Return and tighten each set of the 1/2” mounting hardware, securing the Rail Angles to the Rail Plates of the Strongback Torque all at 72-80 ft.-lbs.

B. Return and tighten each set of the 3/8” mounting hardware, securing the Module Rails to the Rail Angles. Torque all at 32-34 ft.-lbs.

C. Return and tighten each set of 1/4” mounting hardware, securing the PV Modules to the Module rails. Torque all at 6-8 ft.-lbs.
**Step 7: Adjust the Tilt Angle of the Rack**

To adjust the tilt angle, loosen the Pivot Bolt hardware and removing the Support Arm upper hardware attaching the Support Arm to the Strongback. Use great care in this procedure as it can be dangerous if the procedure is not completed as described with a minimum of two people.

A. While one person holds the south edge of rack, the other loosens the Pivot Bolt and removes the upper 1/2” hardware attaching the Support Bar to the Strongback. (See Figure 7-1)

![Figure 7-1: Preparing to Adjust the Tilt Angle](image)

B. Tilt the rack to the desired elevation angle (15°, 25°, 35°, 45°, 55°, or 65°) and re-attach the Support Bar to the Strongback placing the 1/2” hardware in the appropriate hole matching the desired elevation. **Torque to 72-80 ft.-lbs.** (See Figure 7-2)

![Figure 7-2: Setting the Tilt Angle](image)

(continued on next page)
C. Re-tighten the Pivot Bolt. After changing the tilt angle and tightening the Support Bar hardware, the Pivot Bolt must be re-tightened. The Pivot Bolt cannot be left loose - the Mounting Sleeve Vertical Towers must be firmly clamped to the sides of the Strongback, eliminating any gaps between the Vertical Towers and the Strongback. **Torque to 330-350 ft.-lbs.** (See Figure 7-3)
