

Good connections, easy cable entry, and simple installation:
PREFORMED™ Underground Connectors
give you an advantage.

Clear PVC covers, rounded-nose screws, and chamfered conductor ports, make our connectors more field reliable.

Quality connections

Several design features make the Underground Connector line from Preformed Line Products distinctly different. Both the pedestal and stud bar connectors feature chamfered conductor ports to allow cables to enter easily. Both types offer rounded nose screws to take the mystery out of making good connections. It's the round shape that lets you detect the proper torque level.

The width of the conductor screw was designed to be the same as the width of the conductor port making it possible to keep strands of cable from riding up around the threads. This feature makes it possible to maintain a quality connection. The position of the locking set screw is closer to the end of the connector so it's easier to completely tighten the connector on the neutral stud which has two jamb nuts.

Sizes, and options to suit different needs

Pedestal and Stud Bar connectors come in 250 MCM, 350 MCM, and 500 MCM sizes with three to eight hole configurations. Staggered hole connectors are also available.

Several different options can be ordered. Connectors come with or without inhibitor, a street light port, or a clear PVC cover.

Our present inventories allow us to ship from stock, normally having product out in three days. The packaging is marked with a standard quantity, making it easier for customers to keep track of inventory.

Clear advantage

Clear PVC covers are available for all connectors. These premium PVC covers are a full 125 mil thick for safety and long life in the field. The exceptional visibility afforded by the material allows crews to check conductors and assure proper installation. Being able to check positioning is important to detect loose connections.

You can depend on PLP®

We have been committed to being a dependable supplier since 1947. The entire connector line is backed by laboratory and field test data. Moreover, our sales and engineering staff are committed to on-going research and development to further grow the Underground Power line, and meet customer demands. Should you have a special request, or would like more information regarding our Underground Connectors or other Underground Power Products, contact PLP today.
